CLI Reference Guide for ArubaOS-CX, ArubaOS-Switch and Cisco IOS

Introduction

Aruba designed this CLI Reference Guide to help Hewlett Packard Enterprise partners and customers who:

- Manage multi-vendor networks that include HPE/Aruba and Cisco core and aggregation switches
- Have experience deploying Cisco switches and are now deploying HPE/Aruba switches

This CLI Reference Guide compares many of the common commands in three switch operating systems: ArubaOS-CX, ArubaOS-switch and Cisco IOS.

In this guide, we refer to 8400 as ArubaOS-CX, HPE ProVision as ArubaOS-Switch, and Cisco IOS is referenced as Cisco.

The ArubaOS-CX operating system runs on the 8400, 8320 and 8325 switches. The ArubaOS-switch operating system runs on Aruba 2530, Aruba 2920, Aruba 2930F, Aruba 2930M, Aruba 3810M, Aruba 5400R, HPE 2620, HPE 3500, HPE 5400 and HPE 3800 switch platforms.

The commands included in this guide were tested on the following:

- Aruba 8400 – 8 slot chassis with dual management modules running ArubaOS-CX 10.01.0001
- Aruba 3810M-24G-PoE+ switch running ArubaOS-Switch KB.16.03.0003
- Cisco switch running Cisco IOS Software 15.0(1)SE

Additional Aruba and Cisco switches and/or routers were used to provide systems connectivity and operational support as necessary. Likewise, various computers and Voice over IP (VoIP) phones were used to help test functionality and provide output for commands such as **show** or **display**.

Using This Guide

This CLI Reference Guide provides CLI command comparisons in two different formats:

- Side-by-side comparison—Provides a table of the basic commands required to execute a given function in each of the operating systems. In this side-by-side comparison, each platform's commands do not always start at the top of the column. Instead, commands that have similar functions are aligned side by side so that you can easily “translate” the commands on one platform with similar commands on another platform.
- Detailed comparison—Beneath the side-by-side comparison, this guide provides a more in-depth comparison, displaying the output of the command and its options.

Occasionally, the commands required to execute a function or feature in each operating system are completely different. In these instances, each column has the commands necessary to implement the specific function or feature, and the side-by-side comparison does not apply.

Navigation Differences Among CLIs

Basic CLI navigation on all three platforms is very similar, with one notable difference:

- With ArubaOS-CX switches, you can use the **Tab** key for command completion; but you use the **?** key to find more command options. Using tab key also displays the further suboptions without the help description.
- With ArubaOS-Switch, you can use the **Tab** key for command completion; you can also use the **Tab** key or the **?** key to find more command options. In addition, typing “help” at the end of a command may provide additional descriptive information about the command.
- With Cisco, you can use the **Tab** key for command completion, but you use the **?** key to find more command options.

Configuration Differences Among CLIs

For interface IP addressing and interface-specific routing protocol configuration, you execute most commands differently depending on the platform:

- On ArubaOS-CX, you configure the aforementioned components in an interface (VLAN for switch) context. An Interface context can act as layer 3 after assigning an IP address converting it to a Switch Virtual Interface (SVI) of switch ports. There is no physical interface for the VLAN and the SVI provides the Layer 3 processing for packets from all switch ports associated with the VLAN. There is a one-to-one mapping between a VLAN and SVI, thus only a single SVI can be mapped to a VLAN.
- On ArubaOS-Switch, you configure the aforementioned components in a VLAN context. A virtual LAN (VLAN) is any broadcast domain that is partitioned and isolated in a computer network at the data link layer (OSI layer 2). VLANs can keep network applications separate despite being connected to the same physical network, and without requiring multiple sets of cabling and networking devices to be deployed.
- On Cisco, you configure the aforementioned components in an interface (VLAN for switch) context.

Terminology Differences

Among the three operating systems, there are some differences in the terms used to describe features. The table below lists three such terms that could be confusing.

In ArubaOS-CX Switches and Cisco, for example, the term *trunk* refers to an interface that you configure to support 802.1Q VLAN tagged frames. That is, an interface that you configure to support multiple VLANs is a *trunk* interface in each VLAN. In the ArubaOS-Switch operating system, an interface that supports multiple VLANs is a *tagged* interface in each VLAN.

In addition, ArubaOS-CX-Switch refers to aggregated interfaces as a *Link Aggregation Group (LAG)*. ArubaOS-Switch refers to aggregated interfaces as a *trunk*.

Interface use	ArubaOS-CX-Switch	ArubaOS-Switch	Cisco
Non-802.1Q interfaces (such as used for computers or printers)	access	untagged	access
802.1Q interfaces (such as used for switch-to-switch, switch-to-server, and switch-to-VoIP phones)	trunk	tagged	trunk
Aggregated interfaces	lag	trunk	Etherchannel/ Port-Channel
Hybrid port	N/A	hybrid (default)	N/A

Disclaimer

Although Aruba conducted extensive testing to create this guide, it is impossible to test every possible configuration and scenario. Do not assume, therefore, that this document is complete for every environment or each manufacturer's complete product portfolio and software versions. For complete and detailed information on all commands and their options, refer to each manufacturer's documentation accordingly.

Comparing View and Configuration Prompts

The table below compares the differences in each system's display for view and configuration prompts.

Context Legend	ArubaOS-CX-Switch	ArubaOS-Switch	Cisco
U = User Exec / User View	ArubaOS-CX-Switch>	ArubaOS-Switch>	Cisco>
P = Privileged Exec	ArubaOS-CX-Switch#	ArubaOS-Switch#	Cisco#
C = Configuration S = System View	ArubaOS-CX-Switch(config)#	ArubaOS-Switch(config)#	Cisco(config)#

Comparing Frequently Used Commands

The table below lists frequently used commands for each operating system.

	ArubaOS-CX-Switch		ArubaOS-Switch		Cisco
Configuration commands					
C	hostname	C	hostname	C	hostname
C	logging	C	logging	C	logging
C	Not supported	C	router rip	C	router rip
C	access-list	C	access-list	C	access-list
User Exec / Privileged Exec Commands					
U	enable	U	enable	U	enable
P	configure	P	configure	U	configure terminal

P	copy	P/C	copy	P	copy
P	Traceroute6	P/C	Traceroute6	P	Traceroute6
P	traceroute	P/C	traceroute	P	traceroute
P/C	ping / do ping	P/C	ping	P	ping

Chapter 1 Basic Switch Management

This chapter compares commands primarily used for device navigation, device information, and device management.

- Management access
- Configuration and Virtual Terminal access
- Console access
- Reload & Timed reload
- USB
- System and environment
- Remote management sessions (viewing and terminating)
- Tech support output
- Motd
- Source interface for management communications

Management Access CLI comparison

ArubaOS-CX-Switch	ArubaOS-Switch	Cisco
ArubaOS-CX-Switch> enable	ArubaOS-Switch> enable	Cisco> enable

ArubaOS-CX-Switch(config)#	ArubaOS-Switch(config)#	Cisco(config)#

Configuration Access Configurable options

ArubaOS-CX-Switch
<pre>ArubaOS-CX-Switch# configure ? terminal Optional keyword of the configure command. <cr></pre> <pre>ArubaOS-CX-Switch# configure</pre> <pre>ArubaOS-CX-Switch(config)#</pre>
ArubaOS-Switch
<pre>ArubaOS-Switch# configure ? terminal Optional keyword of the configure command. <cr></pre> <pre>ArubaOS-Switch# configure</pre> <pre>ArubaOS-Switch(config)#</pre>
Cisco
<pre>Cisco# configure ? confirm Confirm replacement of running-config with a new config file memory Configure from NV memory network Configure from a TFTP network host overwrite-network Overwrite NV memory from TFTP network host replace Replace the running-config with a new config file revert Parameters for reverting the configuration terminal Configure from the terminal <cr></pre> <pre>Cisco#configure terminal</pre> <pre>Enter configuration commands, one per line. End with CNTL/Z.</pre> <pre>Cisco(config)#</pre>

Console and Virtual Terminal Access—Timeout CLI comparison

ArubaOS-CX-Switch	ArubaOS-Switch	Cisco
Configuration commands		
session-timeout 0	console inactivity-timer	line console 0
		exec-timeout
		line vty 0
		exec-timeout
Note: session works for ssh sessions as well.	Note: console inactivity-timer works for telnet and ssh sessions as well.	

Console and Virtual Terminal Access—Timeout Configurable options

ArubaOS-CX-Switch
<pre>ArubaOS-CX-Switch(config)# session-timeout ? <0-43200> Idle timeout range in minutes. Value 0 disables the timeout (30 is the default configuration setting) ArubaOS-CX-Switch(config)# session-timeout 120 ArubaOS-CX-switch(config)#</pre> <p>Note: session-timeout works for ssh sessions as well.</p>
ArubaOS-Switch
<pre>ArubaOS-Switch(config)# console inactivity-timer ? <0-120> Enter an integer number. (0 is the default configuration setting) ArubaOS-Switch(config)# console inactivity-timer 120 ArubaOS-Switch(config)#</pre> <p>Note: console inactivity-timer works for telnet and ssh sessions as well.</p>

Cisco
<pre>Cisco(config)#line console 0 Cisco(config-line)#exec-timeout ? <0-35791> Timeout in minutes (10 is the default configuration setting) Cisco(config-line)#exec-timeout 20 ? <0-2147483> Timeout in seconds (0 is the default configuration setting) Cisco(config-line)#exec-timeout 20 10 Cisco(config-line)#</pre>

[also]

```
Cisco(config)#line vty 0
```

```
Cisco(config-line)#exec-timeout 20 10
```

Reload & Timed Reload CLI comparison

ArubaOS-CX-Switch	ArubaOS-Switch	Cisco
boot system	reload	reload
boot system '?' <i>Displays further sub-options to boot the system</i>	reload	
show boot-history show boot-history all		show reload
	show reload	

Reload & Timed Reload Configurable options

```

ArubaOS-CX-Switch
ArubaOS-CX-Switch# boot set-default
  primary    Set the default boot image to primary for future reboots
  secondary  Set the default boot image to secondary for future reboots

ArubaOS-CX-Switch# boot fabric-module
  SLOT-ID   The slot ID of the fabric module (e.g., 1/1)

ArubaOS-CX-Switch# boot line-module
  SLOT-ID   The slot ID of the line module (e.g., 1/1)

ArubaOS-CX-Switch# boot management-module
  SLOT_ID   Reboot a management module by slot number (e.g. 1/5)
  active    Reboot the active management module
  standby   Reboot the standby management module

ArubaOS-CX-Switch# boot system

  primary    Reboot the system to the primary image
  secondary  Reboot the system to the secondary image
  serviceos  Reboot both MMs to ServiceOS
  <cr>

ArubaOS-CX-Switch# boot system primary
  <cr>

ArubaOS-CX-Switch# boot system primary
Default boot image set to primary.

Do you want to save the current configuration (y/n)? y
The running configuration was saved to the startup configuration.

This will reboot the entire switch and render it unavailable
until the process is complete.
Continue (y/n)? y
The system is going down for reboot.

ArubaOS-CX-Switch# boot system
  primary    Reboot the system to the primary image
  secondary  Reboot the system to the secondary image
  serviceos  Reboot both MMs to ServiceOS
  <cr>

ArubaOS-CX-Switch# boot system secondary
  issu      Perform an in service system upgrade to the secondary image
  <cr>

```

```
ArubaOS-CX-Switch# boot system secondary
Default boot image set to secondary.
```

```
Do you want to save the current configuration (y/n)? y
The running configuration was saved to the startup configuration.
```

```
This will reboot the entire switch and render it unavailable
until the process is complete.
```

```
Continue (y/n)? y
The system is going down for reboot.
```

ArubaOS-Switch

```
ArubaOS-Switch# reload
System will be rebooted from primary image. Do you want to continue [y/n]?
```

```
[for timed reboot]
```

```
ArubaOS-Switch# reload ?
after          Warm reboot in a specified amount of time.
at             Warm reboot at a specified time; If the mm/dd/yy is left blank,
               the current day is assumed.
<cr>
```

```
ArubaOS-Switch# reload at ?
HH:MM[:SS]    Time on given date to do a warm reboot.
```

```
ArubaOS-Switch# reload at 23:00 ?
MM/DD[/[YY]YY]  Date on which a warm reboot is to occur.
<cr>
```

```
ArubaOS-Switch# reload at 23:00 03/04/2015 ?
<cr>
```

```
ArubaOS-Switch# reload at 23:00 03/04/2015
Reload scheduled at 23:00:13 03/04/2015
                (in 0 days, 23 hours, 12 minutes)
System will be rebooted at the scheduled time from primary image.
Do you want to continue [y/n]? y
ArubaOS-Switch#
```

```
-or-
```

```
ArubaOS-Switch# reload after
[[DD:]HH:]MM   Enter a time.
```

```
ArubaOS-Switch# show reload ?
after          Shows the time until a warm reboot is scheduled.
at             Shows the time and date a warm reboot is scheduled.
```

```
ArubaOS-Switch# show reload after
Reload scheduled for 23:00:57 03/04/2015
                (in 0 days, 23 hours, 9 minutes)
```

```
ArubaOS-Switch(config)# no reload
```

```
ArubaOS-Switch(config)# show reload after
reload is not scheduled
```

```
Cisco#reload
Proceed with reload? [confirm]
```

[for timed reboot]

```
Cisco#reload ?
 /noverify  Don't verify file signature before reload.
 /verify    Verify file signature before reload.
 LINE      Reason for reload
 at        Reload at a specific time/date
 cancel    Cancel pending reload
 in        Reload after a time interval
 slot      Slot number card
 standby-cpu Standby RP
 <cr>
```

```
Cisco#reload at ?
 hh:mm     Time to reload (hh:mm)
```

```

Chapter 2 Switch User ID and Password, and Console Access

This chapter focuses on:

- Configuring local user ID (uid) and password (pw) options
- Recovering from a lost password
- Protecting the local password
- Role based management
- Password complexity

For network access, Cisco requires at least pw, while ArubaOS-Switch does not require either.

Network access methods for device management are covered in Chapters 8 and 9. Configuration details for Telnet and SSH are found in Chapter 8, and HTTP and HTTPS are found in Chapter 9.

Local User ID and Password, and console access CLI comparison

Recover lost password CLI comparison

ArubaOS-CX-Switch	ArubaOS-Switch	Cisco
See details below	See details below	See details below

Each procedure requires direct access to the switch through a console cable.

Recover lost password CLI Configurable options

ArubaOS-CX-Switch
<pre>switch login: admin Password: <forgot-password> One Time Token for password reset (valid for 30 mins) : AAEAAQABAAEAgI79uC8K+JJKJvxSu+U3JH7iLw8SqqaN/UdKYZeZw0WdXxKnhUQVamggmN5ZqJCLfXUnXAGvOES4eyBX5 p/FwcoYvBFF2dIJ5g5FeYOC862NTL95wmEX01e5V4VqhSVtxeMYOeuanzlmzSfkBZa0FWXVOWYHou3ptfj1JjPLjzb3</pre> <p>Login to MNP portal @ www.hpe.com/networking/register to generate the One-Time-Password. Copy the OTP and input at the prompt below. Enter the One-Time-Password:</p>
ArubaOS-Switch
<p>Requires direct access to the switch (option 3 requires console cable). Default front panel security settings has all three options enabled.</p> <p>Option 1) erase local usernames/passwords by depressing front panel clear button for one second. Requires physical access to switch.</p> <p>Option 2) execute a factory reset by using a combination/sequence of the “clear” button and the “reset” button (reference product documentation for details). Requires physical access to switch.</p> <p>Option 3) password recovery procedure requires direct access to the switch (with console cable) and calling HPE Networking technical support (reference product documentation for details).</p>
Cisco
<p>Depending on configuration of the “password-recovery” feature (see section c, Protect Local Password), there are two methods available; both require direct access to the switch (with console cable) and depressing the appropriate front panel button.</p> <p>See the Cisco product documentation for exact procedure.</p>

Chapter 3 Time Service

This chapter compares commands to configure and synchronize the switch time with a trusted time source, using time protocols such as Network Time Protocol (NTP) and Simple NTP (SNTP).

Using time synchronization ensures a uniform time among interoperating devices. This helps to manage and troubleshoot switch operation by attaching meaningful time data to event and error messages.

NTP CLI Comparison

ArubaOS-CX-Switch	ArubaOS-Switch	Cisco

Chapter 4 CLI Management Access – SSH

This chapter compares the commands to enable and configure Secure Shell (SSH) services for device management via unencrypted and encrypted network access.

Note: ssh on Cisco does not support 'local' (password only) on vty interfaces and must be configured for 'login local'.

You can find configuration details for User ID's and Password's in Chapter 2.

SSH CLI Comparison

ArubaOS-CX-Switch	ArubaOS-Switch	Cisco
Configuration commands		
hostname ArubaOS-CX-Switch		hostname Cisco
ip dns domain-name HPE-Aruba		ip domain-name test

Chapter 5 GUI Management Access – HTTPS

This chapter compares the commands used to enable and configure browser-based applications to manage the switch via unencrypted and encrypted network access methods.

Enable standard TCP port 80 access for unencrypted management access to the switch.

For encrypted management access to the switch use TCP port 443, and must configure Secure Sockets Layer (SSL).

You can find configuration details for User ID's and Password's in Chapter 2.

HTTPS CLI Comparison

ArubaOS-CX-Switch	ArubaOS-Switch	Cisco
<p>HTTP access is disabled by default and is available as soon as it is enabled manually using CLI</p> <p>To control HTTPS access with UID/PW or PW (only), see Ch2 for configuring UID/PW or PW only.</p>	<p>HTTP access is enabled by default and is available as soon as an IP addr is assigned to a VLAN, without UID/PW access control.</p> <p>To control HTTPS access with UID/PW or PW (only), see Ch2 for configuring UID/PW or PW only.</p>	<p>HTTP server is enabled by default, but must configure http authentication type.</p> <p>Must have all the device web files for full functionality.</p>
user admin password		username <name> privilege 15 password <password>
https-server vrf <mgmt/default>	web-management plaintext	ip http server
https-server rest access-mode read-only		ip http authentication local
https-server rest access-mode read-write		
show https-server		show ip http server connection

HTTPS Service configurable options

ArubaOS-CX-Switch
<pre>ArubaOS-CX-Switch(config)# https-server rest REST API configuration vrf Configure HTTPS Server for VRF ArubaOS-CX-Switch(config)# https-server rest access-mode REST API access-mode configuration ArubaOS-CX-Switch(config)# https-server rest access-mode read-only Allow reads only (default) read-write Allow reads and writes ArubaOS-CX-Switch(config)# https-server rest access-mode read-only <cr></pre>

```
ArubaOS-CX-Switch(config)# https-server rest access-mode read-only
ArubaOS-CX-Switch(config)# https-server rest access-mode read-write
ArubaOS-CX-Switch(config)# do sh https-server
<cr>
```

```
ArubaOS-CX-Switch(config)# do sh https-server
```

```
HTTPS Server Configuration
-----
VRF                : <none>

REST Access Mode   : read-write
```

ArubaOS-Switch

HTTP access is enabled by default and is available as soon as an IP addr is assigned to a VLAN, without UID/PW access control. If passwords are assigned to the operator and/or manager users, then those will be used during HTTP access.

```
ArubaOS-Switch(config)# web-management
idle-timeout      Set the idle timeout for web management sessions.
listen            Specify in which mode HTTP Server should listen in
management-url   Specify URL for web interface [?] button.
plaintext         Enable/disable the http server (insecure).
ssl              Enable/disable the https server (secure).
support-url       Specify URL for web interface Support page.
<cr>
```

```
ArubaOS-Switch(config)# web-management plaintext
<cr>
```

```
ArubaOS-Switch(config)# web-management plaintext
```

Note, even though the above command can be entered to enable HTTP access, it is the default state and will not appear in the configuration.

Cisco

HTTP server is enabled by default, but must configure http authentication type.

Note: must have all the device web files (these are in addition to IOS) on the switch for full functionality.

```
Cisco(config)#username manager privilege 15 password password
```

```
Cisco(config)#ip http ?
access-class      Restrict http server access by access-class
active-session-modules Set up active http server session modules
authentication    Set http server authentication method
client           Set http client parameters
help-path        HTML help root URL
max-connections  Set maximum number of concurrent http server
connections
path             Set base path for HTML
port            Set http server port

```

Chapter 6 Discovery Protocols – LLDP

Link Layer Discovery Protocol (LLDP) and Cisco Discovery Protocol (CDP) , both are link layer protocols which helps to discover directly connected LLDP and CDP-capable neighbors

- Link Layer Discovery Protocol (LLDP), an industry standard protocol for device discovery
- Cisco Discovery Protocol (CDP), a Cisco-specific protocol for device discovery.

This chapter covers the commands required to configure LLDP.

ArubaOS-Switch provide limited support for CDP.

In a heterogeneous network, a standard configuration exchange platform ensures that different types of network devices from different vendors can discover one another and exchange configuration for the sake of interoperability and management.

LLDP CLI Comparision

Chapter 7 Out-of-Band Management

One of the first key questions about securing a network switch is “Is my management traffic in-band or out-of-band?” The differences can be described as follows:

- In-band – switch management traffic travels with the network data traffic on the data plane and can be impacted when communication problems arise on the data plane
- Out-of-band – switch management traffic travels on a different plane than the network data traffic and is not impacted when communication problems arise on the data plane.

In documentation, it is common to describe “out-of-band” connections as being associated with the Management Plane and “in-band” connections as being associated with the Data Plane.

Management Plane

Serial Console: For the out-of-band, switches supports a serial console allowing a computer or console server to connect. This connection is speed limited and limited to the Command Line Interface. In addition, the serial interface doesn't support other types of management traffic – like RADIUS, SNMP, or Syslog – where the switch is acting like a client.

Out-of-band Management (OOBM) and Management ports generally refer to an Ethernet port that is dedicated to management. A variety of protocols can be supported over the management port based on available features by product/operating system.

Data Plane

A management Virtual Local Area Network (VLAN) is a VLAN with severe network configuration restrictions focused only on switch management.

A loopback interface can be protected using Access Control Lists, and when combined with other security settings, can offer a high degree of security confidence when a management VLAN is too restrictive.

A Data Plane configuration for switch management may be necessary if you need to manage the switch via a Fiber connection since OOBM ports are RJ-45 or if there is no OOBM ports on the switch. In addition, using the Loopback interface method, you can have and control access from multiple VLANs in the network. Of course the downside is that such connections are in the Data Plane and subject to interruption by Data Plane troubles.

Out-Of-Band CLI Comparison

ArubaOS-CX-Switch	ArubaOS-Switch	Cisco
Configuration commands

```

ArubaOS-Switch(config)# oobm
  disable           Disable OOBM.
  enable            Enable OOBM.
  interface         Configure various interface parameters for OOBM.
  ip                Configure various IP parameters for the OOBM.
  ipv6              Configure various IPv6 parameters for the OOBM.
  ntp               Enable/configure NTP operation on the VLAN/OOBM.
  <cr>

ArubaOS-Switch(oobm)# ip ?
  address           Set IP parameters for communication within an IP network.
  default-gateway   Configure the IPv4 default gateway address, which will be used
                    when routing is not enabled on the switch.

ArubaOS-Switch(oobm)# ip address ?
  dhcp-bootp        Configure the interface to use DHCP/Bootp server to acquire
                    parameters.
  IP-ADDR/MASK-LENGTH Interface IP address/mask.

ArubaOS-Switch(oobm)# ip address 10.199.111.21/24 ?
  <cr>
ArubaOS-Switch(oobm)# ip address 10.199.111.21/24

ArubaOS-Switch(oobm)# ip default-gateway ?
  IP-ADDR           IPv4 address of the default gateway.

ArubaOS-Switch(oobm)# ip default-gateway 10.199.111.1 ?
  <cr>
ArubaOS-Switch(oobm)# ip default-gateway 10.199.111.1

ArubaOS-Switch(config)# telnet-server listen ?
  oobm              Enable Telnet Server on OOBM Interface only.
  data              Enable Telnet Server on Data Plane only.
  both              Enable Telnet Server on both OOBM and Data planes.

ArubaOS-Switch(config)# telnet-server listen oobm

ArubaOS-Switch(config)# ip ssh listen ?
  oobm              Enable SSH on OOBM Interface only.
  data              Enable SSH on Data Plane only.
  both              Enable SSH on both OOBM and Data planes.

ArubaOS-Switch(config)# ip ssh listen oobm

ArubaOS-Switch(config)# web-management listen ?
  oobm              Enable HTTP Server on OOBM Interface only.
  data              Enable HTTP Server on Data Plane only.

```

```

both                Enable HTTP Server on both OOBM and Data planes.

ArubaOS-Switch(config)# web-management listen oobm

ArubaOS-Switch(config)# ntp server 10.199.111.251 ?
burst               Enables burst mode.
iburst              Enables initial burst (iburst) mode.
key-id              Set the authentication key to use for this server.
max-poll            Configures the maximum time intervals in seconds.
min-poll            Configures the minimum time intervals in seconds.
oobm                Use the OOBM interface to connect to the server.
<cr>

ArubaOS-Switch(config)# ntp server 10.199.111.251 oobm ?
burst               Enables burst mode.
iburst              Enables initial burst (iburst) mode.
key-id              Set the authentication key to use for this server.
max-poll            Configures the maximum time intervals in seconds.
min-poll            Configures the minimum time intervals in seconds.
<cr>

ArubaOS-Switch(config)# ntp server 10.199.111.251 oobm

ArubaOS-Switch# ping 10.199.111.51 ?
ip-option           Specify the IP options to use.
tos                 Specify the Type of Service value to send.
data-fill           Specify the data pattern to send.
data-size           Specify the ping data size.
interval            Specify the interval between pings in seconds.
repetitions         Ping the device multiple times.
source              Specify the ping source.
timeout             Specify the ping timeout in seconds.
<cr>

ArubaOS-Switch# ping 10.199.111.51 source ?
IP-ADDR             The source IPv4 address.
loopback            Specify the source loopback interface.
oobm                Use the OOBM interface.
VLAN-ID             The source VLAN.

ArubaOS-Switch# ping 10.199.111.51 source oobm ?
data-fill           Specify the data pattern to send.
data-size           Specify the ping data size.
interval            Specify the interval between pings in seconds.
repetitions         Ping the device multiple times.
timeout             Specify the ping timeout in seconds.
<cr>

ArubaOS-Switch# ping 10.199.111.51 source oobm
10.199.111.51 is alive, time = 1 ms

ArubaOS-Switch# copy tftp flash 10.199.111.200 KA_16_01_0006.swi primary ?
oobm                Use the OOBM interface to reach TFTP server.
<cr>

ArubaOS-Switch# copy tftp flash 10.199.111.200 KA_16_01_0006.swi primary oobm ?

<cr>
ArubaOS-Switch# copy tftp flash 10.199.111.200 KA_16_01_0006.swi primary oobm

```

```
ArubaOS-Switch# show lldp info remote-device ?
oobm                Show local or remote device information for the OOBM port.
[ethernet] PORT-LIST Show local or remote device information for the specified ports.
<cr>
```

```
ArubaOS-Switch# show lldp info remote-device oobm ?
<cr>
```

ip	Interface Internet Protocol config commands
ipv6	IPv6 interface subcommands
isis	IS-IS commands
iso-igrp	ISO-IGRP interface subcommands
keepalive	Enable keepalive
link	Configure Link
lldp	LLDP interface subcommands
load-interval	Specify interval for load calculation for an interface
location	Interface location information
logging	Configure logging for interface
loopback	Configure internal loopback on an interface
macro	Command macro
max-reserved-bandwidth	Maximum Reservable Bandwidth on an Interface
mka	MACsec Key Agreement (MKA) interface configuration
neighbor	interface neighbor configuration mode commands
network-policy	Network Policy
nmsp	NMSP interface configuration
no	Negate a command or set its defaults
ntp	Configure NTP
pagp	PAGP interface subcommands
power	Power configuration
rate-limit	Rate Limit
routing	Per-interface routing configuration
service-policy	Configure CPL Service Policy
shutdown	Shutdown the selected interface
small-frame	Set rate limit parameters for small frame
snmp	Modify SNMP interface parameters
source	Get config from another source
spanning-tree	Spanning Tree Subsystem
speed	Configure speed operation.
standby	HSRP interface configuration commands
timeout	Define timeout values for this interface
topology	Configure routing topology on the interface
traffic-shape	Enable Traffic Shaping on an Interface or Sub-Interface
transmit-interface	Assign a transmit interface to a receive-only interface
tx-ring-limit	Configure PA level transmit ring limit
vrf	VPN Routing/Forwarding parameters on the interface
vrrp	VRRP Interface configuration commands
vtp	Enable VTP on this interface

Cisco(config-if)#ip ?

Interface IP configuration subcommands:

access-group	Specify access control for packets
accounting	Enable IP accounting on this interface
address	Set the IP address of an interface
admission	Apply Network Admission Control
auth-proxy	Apply authentication proxy
authentication	authentication subcommands
bandwidth-percent	Set EIGRP bandwidth limit
bgp	BGP interface commands
broadcast-address	Set the broadcast address of an interface
cef	Cisco Express Forwarding interface commands
cgmp	Enable/disable CGMP
dampening-change	Percent interface metric must change to cause update
dampening-interval	Time in seconds to check interface metrics
dhcp	Configure DHCP parameters for this interface
directed-broadcast	Enable forwarding of directed broadcasts
flow	NetFlow related commands
header-compression	IPHC options
hello-interval	Configures EIGRP-IPv4 hello interval

helper-address	Specify a destination address for UDP broadcasts
hold-time	Configures EIGRP-IPv4 hold time
igmp	IGMP interface commands
information-reply	Enable sending ICMP Information Reply messages
irdp	ICMP Router Discovery Protocol
load-sharing	Style of load sharing
local-proxy-arp	Enable local-proxy ARP
mask-reply	Enable sending ICMP Mask Reply messages
mrm	Configure IP Multicast Routing Monitor tester
mrout-cache	Enable switching cache for incoming multicast packets
mtu	Set IP Maximum Transmission Unit
multicast	IP multicast interface commands
next-hop-self	Configures EIGRP-IPv4 next-hop-self
ospf	OSPF interface commands
pim	PIM interface commands
policy	Enable policy routing
probe	Enable HP Probe support
proxy-arp	Enable proxy ARP
rarp-server	Enable RARP server for static arp entries
redirects	Enable sending ICMP Redirect messages
rgmp	Enable/disable RGMP
rip	Router Information Protocol
route-cache	Enable fast-switching cache for outgoing packets
router	IP router interface commands
rsvp	RSVP Interface Commands
rtp	RTP parameters
sap	Session Advertisement Protocol interface commands
security	DDN IP Security Option
split-horizon	Perform split horizon
sticky-arp	Allow the creation of sticky ARP entries
summary-address	Perform address summarization
tcp	TCP interface commands
unnumbered	Enable IP processing without an explicit address
unreachables	Enable sending ICMP Unreachable messages
urd	Configure URL Rendezvousing
verify	Enable per packet validation
vrf	VPN Routing/Forwarding parameters on the interface
wccp	WCCP interface commands

Cisco(config-if)#ip address ?

```

A.B.C.D  IP address
dhcp     IP Address negotiated via DHCP
pool     IP Address autoconfigured from a local DHCP pool

```

Cisco(config-if)#ip address 10.199.111.41 255.255.255.0 ?

```

secondary  Make this IP address a secondary address
<cr>

```

Cisco(config-if)#ip address 10.199.111.41 255.255.255.0

Cisco(config)#ip telnet ?

```

comport    Specify RFC 2217 options
hidden     Don't display telnet addresses or hostnames
quiet      Don't display non-error telnet messages
source-interface  Specify source interface
tos        Specify type of service

```

Cisco(config)#ip telnet source-interface ?

Async	Async interface

Chapter 8 Interface or Port Information and Nomenclature

This chapter compares the commands used to collect information about interfaces; configure interface names, speeds, and/or duplex settings; and disable/enable interfaces. It also compares differences between interface and VLAN context.

These commands help on how each operating system references ports. ArubaOS-Switch ASIC chassis-based (modular) switches and stackable switches that have a module slot designate ports using the format "slot/port." For example, on the HP 8212 zl switch, port 24 on the module in slot A is referred to as interface A24. Stackable switches simply use the port number.

Cisco switches (both chassis-based and stackable) designate ports using the format "interface_type slot/sub-slot/port" or "interface_type slot/port."

Interface or Port Information CLI Comparison

ArubaOS-CX-Switch	ArubaOS-Switch	Cisco
Configuration commands		
interface 1/1/1	Interface 1/1	interface g1/0/1
interface loopback <number>		interface loopback <number>
[configuring a SVI interface:] interface vlan 1		interface vlan <number>
For creating a L2 VLAN: vlan 5	vlan 5	vlan 5
description link-to-core	name link-to-core	description link-to-core
shutdown no shutdown	disable enable	shutdown no shutdown
ip address 10.93.20.10/24		ip address 10.93.20.10 255.255.255.0
		speed auto

```

```
ArubaOS-CX-Switch(config)# interface 1/1/1
```

```

ArubaOS-CX-Switch(config)# vlan {vlan-id | vlan-range}
SW-BA-01(config)# vlan 5

```

"This command creates a VLAN or a range of VLANs. If you enter a number that is already assigned to a VLAN, the device puts you into the VLAN configuration submode for that VLAN. If you enter a number that is assigned to an internally allocated VLAN, the system returns an error message. However, if you enter a range of VLANs and one or more of the specified VLANs is outside the range of internally allocated VLANs, the command takes effect on only those VLANs outside the range. The range is from 2 to 4094; VLAN1 is the default VLAN and

cannot be created or deleted. You cannot create or delete those VLANs that are reserved for internal use."

arp-protect    Configure the port as trusted or untrusted.  
bandwidth-min  Enable/disable and configure guaranteed minimum bandwidth  
               settings for outgoing traffic on the port(s).  
broadcast-limit Limit network bandwidth used by broadcast traffic.  
dhcp-snooping  Configure port-specific DHCP snooping parameters.  
dhcpv6-snooping Configure DHCPv6 snooping settings on a port.  
disable        Disable interface.  
enable         Enable interface.  
energy-efficient-e... Enables or disables EEE on each port in the port list.  
flow-control   Enable/disable flow control negotiation on the port(s) during  
               link establishment.  
forbid         Prevent ports from becoming a member of specified VLANs.  
gvrp           Set the GVRP timers for the port.
```

```

ignore-untagged-mac Prevent MAC address learning for certain untagged control
                    traffic.
ip Apply an access control list to inbound packets on port.
ipv6 Configure various IPv6 parameters for the VLAN.
lACP Define whether LACP is enabled on the port, and whether it is in
      active or passive mode when enabled.
link-keepalive Configure UniDirectional Link Detection (UDLD) on the port.
mac-count-notify Send a trap when the number of MAC addresses learned on the
                  specified ports exceeds the threshold.
mac-notify Configures SNMP traps for changes in the MAC address table.
mdix-mode Set port MDI/MDIX mode (default: auto).
monitor Monitor traffic on the port.
name Change the interface name.
poe-allocate-by Configure the power allocation method.
poe-lldp-detect Enabling this feature causes the port to allocate power based on
                the link-partner's capabilities via LLDP.
poe-value Set the maximum power allocation for the port.
power-over-ethernet Enable per-port power distribution.
qos Configure port-based traffic prioritization.
rate-limit Enable rate limiting for various types of traffic.
service-policy Apply the QoS/Mirror policy on the interface.
smart-link Configure the control VLANs for receiving flush packets.
speed-duplex Define mode of operation for the port(s).
tagged Assign ports to specified VLANs as tagged.
unknown-vlans Configure the GVRP mode.
untagged Assign ports to specified VLAN as untagged.

Vif	PGM Multicast Host interface
Virtual-Template	Virtual Template interface
Virtual-TokenRing	Virtual TokenRing
Vlan	Catalyst Vlans
fcpa	Fiber Channel
range	interface range command

```
Cisco(config)#interface g1/0/1
```

```
Cisco(config-if)#?
```

Interface configuration commands:

aaa	Authentication, Authorization and Accounting.
arp	Set arp type (arpa, probe, snap) or timeout or log options
auto	Configure Automation
bandwidth	Set bandwidth informational parameter
bgp-policy	Apply policy propagated by bgp community string
carrier-delay	Specify delay for interface transitions
cdp	CDP interface subcommands
channel-group	Etherchannel/port bundling configuration
channel-protocol	Select the channel protocol (LACP, PAGP)
cts	Configure Cisco Trusted Security
dampening	Enable event dampening
datalink	Interface Datalink commands
default	Set a command to its defaults
delay	Specify interface throughput delay
description	Interface specific description
down-when-looped	Force looped interface down
duplex	Configure duplex operation.
eou	EAPoUDP Interface Configuration Commands
exit	Exit from interface configuration mode
flow-sampler	Attach flow sampler to the interface
flowcontrol	Configure flow operation.
help	Description of the interactive help system
history	Interface history histograms - 60 second, 60 minute and 72 hour
hold-queue	Set hold queue depth
ip	Interface Internet Protocol config commands
keepalive	Enable keepalive
l2protocol-tunnel	Tunnel Layer2 protocols
lACP	LACP interface subcommands
link	Configure Link
lldp	LLDP interface subcommands
load-interval	Specify interval for load calculation for an interface
location	Interface location information
logging	Configure logging for interface
mac	MAC interface commands
macro	Command macro
max-reserved-bandwidth	Maximum Reservable Bandwidth on an Interface
mdix	Set Media Dependent Interface with Crossover
mka	MACsec Key Agreement (MKA) interface configuration
mls	mls interface commands
mvr	MVR per port configuration
neighbor	interface neighbor configuration mode commands
network-policy	Network Policy
nmsp	NMSP interface configuration
no	Negate a command or set its defaults
pagp	PAGP interface subcommands
priority-queue	Priority Queue
queue-set	Choose a queue set for this queue
rmon	Configure Remote Monitoring on an interface
routing	Per-interface routing configuration
rsu	rolling stack upgrade
service-policy	Configure CPL Service Policy
shutdown	Shutdown the selected interface
small-frame	Set rate limit parameters for small frame
snmp	Modify SNMP interface parameters

source	Get config from another source
spanning-tree	Spanning Tree Subsystem
speed	Configure speed operation.
srr-queue	Configure shaped round-robin transmit queues
storm-control	storm configuration
switchport	Set switching mode characteristics
timeout	Define timeout values for this interface
topology	Configure routing topology on the interface
transmit-interface	Assign a transmit interface to a receive-only interface
tx-ring-limit	Configure PA level transmit ring limit
udld	Configure UDLD enabled or disabled and ignore global UDLD setting
vtp	Enable VTP on this interface

```

Cisco(config-if)#no shutdown
```

Chapter 9 Link Aggregation – LACP and Trunk

This chapter compares the commands to configure aggregation interfaces.

The IEEE 802.3ad Link Aggregation Control Protocol (LACP) enables dynamic aggregation of physical links. It uses Link Aggregation Control Protocol Data Units (LACPDU) to exchange aggregation information between LACP-enabled devices.

There are some terminology differences among the operating systems for the terms used to define port aggregation. In ArubaOS-Switch, aggregated links are called *trunks*. In Cisco, the term is *EtherChannel*.

In addition, Cisco Etherchannel has two modes: PAgP (Cisco specific) or LACP. LACP mode is shown in the Cisco configuration examples.

In Cisco, *trunk* refers to an interface that is configured to support multiple VLANs via 802.1Q.

This chapter covers the configuration of LACP port aggregation—sometimes referred to as protocol trunks, which are dynamic in their operation—and non-LACP port aggregation, sometimes referred to as non-protocol trunks, which are basically “on,” because no protocol is used to negotiate the aggregated links.

Generally, execute the configuration steps first then connect the links -or- disable/shutdown the interfaces, execute the configuration steps, then enable/undo or no shutdown the interfaces. Otherwise network loops could accidentally be created and cause other issues/outages.

Link Aggregation Control Protocol (LACP) CLI comparison

ArubaOS-CX-Switch	ArubaOS-Switch	Cisco
Configuration commands		
interface lag 1	Trunk 1/20,1/24 trk1 lacp	interface port-channel 1 switchport mode trunk encapsulation dot1q switchport mode access

show lacp aggregates	show vlans 220 show vlans ports trk1 detail	show vlan name test

Link Aggregation Configurable options

ArubaOS-CX-Switch

```
ArubaOS-CX-Switch(config)# interface
  IFNAME      Interface's name
  IFNAME      PORT identifier range.
  lag         Configure link-aggregation parameters
  loopback    Configure loopback interface
  mgmt        Configure management interface
  tunnel      Tunnel Configuration
  vlan        VLAN configuration

ArubaOS-CX-Switch(config)# interface lag
  <1-128>     LAG number ranges from 1 to 128

ArubaOS-CX-Switch(config)# interface lag 1
  multi-chassis  Configure LAG as Multi-chassis
  <cr>

ArubaOS-CX-Switch(config)# interface lag 1

ArubaOS-CX-Switch(config-lag-if)#
  apply        Apply a configuration record
  arp          Configure ARP commands
  description  Add a description
  end          End current mode and change to enable mode
  exit        Exit current mode and change to previous mode
  ip          IP information
  ipv6        IPv6 information
  l3-counters Enable both Rx and Tx L3 counters
  lacp        Configure LACP parameters
  list        Print command list
  loop-protect Configure loop protection
  mclag       Configure mclag parameters
  mvrp        Enable the Multiple VLAN Registration Protocol (MVRP)
  no          Negate a command or set its defaults
  qos         Quality of Service configuration
  rate-limit  Apply a rate-limit to a specific traffic type for this port
  routing     Configure interface as L3
  sflow       Enable sFlow
  shutdown    Enable/disable a LAG
  spanning-tree Spanning-tree configuration
  track       Track information
  vlan        VLAN configuration
  vrf         VRF Configuration
  vrrp        VRRP information

ArubaOS-CX-Switch(config-lag-if)# vlan
  access      Access configuration
  trunk       Trunk configuration

ArubaOS-CX-Switch(config-lag-if)# vlan trunk

Chapter 10 MSTP

Developed based on the IEEE 802.1s standard, Multiple Spanning Tree Protocol (MSTP) overcomes the limitations of STP and RSTP. In addition to support for rapid network convergence, it allows data flows of different VLANs to be forwarded along separate paths, providing a better load-sharing mechanism for redundant links.

MSTP uses multiple spanning tree instances with separate forwarding topologies. Each instance is composed of one or more VLANs, which significantly improves network link utilization and the speed of reconvergence after a failure in the network's physical topology. However, MSTP requires more configuration overhead and is more susceptible to dropped traffic due to misconfiguration.

This chapter compares the commands to configure Multiple Spanning Tree Protocol (MSTP). The four operating systems implement MSTP differently:

- ArubaOS-Switch uses MSTP as the default STP version. *MSTP is not enabled by default.* When MSTP is enabled, all ports are auto-edge-ports.
- Cisco uses Per-VLAN Spanning Tree Plus (PVST+) as the default STP version and it *is enabled by default.* If you enable MSTP, all ports are non-edge ports.

MSTP CLI Comparison

ArubaOS-CX-Switch	ArubaOS-Switch	Cisco

MSTP CLI Configurable options

ArubaOS-CX-Switch	
ArubaOS-CX-Switch(config)# spanning-tree	
config-name	Set the MST region configuration name
config-revision	Set the MST region configuration revision number
extend-system-id	Enables the extended system-id functionality.
forward-delay	Set the forward delay for the Multiple spanning tree
hello-time	Set the hello interval for the Multiple spanning tree
ignore-pvid-inconsistency	Ignore PVID inconsistencies and allow, RPVST to run on mismatched links.
instance	Create, delete or configure an MST instance
max-age	Set the max age interval for the Multiple spanning tree
max-hops	Set the max hops value for the Multiple spanning tree
mode	Specify the spanning-tree mode
pathcost-type	Specify the path cost type.
priority	Set the device priority multiplier. This value will be multiplied by 4096
transmit-hold-count	Sets the transmit hold count performance parameter in pps
trap	Enable STP/MSTP traps
vlan	VLAN configuration
<cr>	

```

ArubaOS-CX-Switch(config)# spanning-tree

ArubaOS-Switch(config)# spanning-tree ?
```

```
bpdu-protection-ti... Set the time for protected ports to be in down state after
receiving unauthorized BPDUs.
bpdu-throttle          Configure BPDU throttling on the device.
clear-debug-counters  Clear spanning tree debug counters.
config-name           Set the MST region configuration name (default is switch's MAC
address).
config-revision       Set the MST region configuration revision number (default is 0).
enable                Enable spanning-tree.
disable               Disable spanning-tree.
extend                Enable the extended system ID feature.
force-version         Set Spanning Tree protocol compatibility mode.
forward-delay         Set time the switch waits between transitioning from listening to
learning and from learning to forwarding states. Not applicable in
RPVST mode.
hello-time            Set time between messages transmission when the switch is root.
Not applicable in RPVST mode.
ignore-pvid-incons... Ignore PVID inconsistencies, allowing Rapid PVST to run on
mismatched links.
instance              Create, delete or configure an MST instance.
legacy-mode           Set spanning-tree protocol to operate either in 802.1D legacy mode
or in 802.1s native mode.
legacy-path-cost      [Deprecated] Set 802.1D (legacy) or 802.1t (current) default
pathcost values.
log                   Enable event logging for port state transition information.
max-hops              Set the max number of hops in a region before the MST BPDU is
discarded and the information held for a port is aged (default is
20).
maximum-age          Set maximum age of received STP information before it is
discarded. Not applicable in RPVST mode.
mode                  Specify spanning-tree mode.
pathcost              Specify a standard to use when calculating the default pathcost.
pending               Manipulate pending MSTP configuration.
port                  Configure port specific RPVST parameters for the specified VLANs.
[ethernet] PORT-LIST Configure the port-specific parameters of the spanning tree
protocol for individual ports.
priority              Set the device STP priority (the value is in range of 0-61440
divided into steps of 4096 that are numbered from 0 to 15, default
is step 8). Not applicable in RPVST mode.
root                  Configure root for STP.
trap                  Enable/disable STP/MSTP/RPVST traps.
vlan                  Specify RPVST VLAN specific parameters.

ArubaOS-Switch(config)# spanning-tree 9 ?
admin-edge-port      Set the administrative edge port status.
auto-edge-port       Set the automatic edge port detection.
bpdu-filter          Stop a specific port or ports from transmitting BPDUs, receiving
                    BPDUs, and assume a continuous forwarding state.
bpdu-protection      Disable the specific port or ports if the port(s) receives STP
                    BPDUs.
hello-time           Set message transmission interval (in sec.) on the port. Not
                    applicable in RPVST mode.
loop-guard           Set port to guard against the loop and consequently to prevent it
                    from becoming Forwarding Port.
mcheck              Force the port to transmit RST BPDUs. Not applicable in RPVST
                    mode.
path-cost            Set port's path cost value. Not applicable in RPVST mode.
point-to-point-mac  Set the administrative point-to-point status.
priority            Set port priority (the value is in range of 0-240 divided into
                    steps of 16 that are numbered from 0 to 15, default is step 8).
                    Not applicable in RPVST mode.
pvst-filter         Stop a specific port or ports from receiving and retransmitting
                    PVST BPDUs. Not applicable in RPVST mode.
pvst-protection     Disable the specific port or ports if the port(s) receives PVST
                    BPDUs. Not applicable in RPVST mode.
root-guard          Set port to ignore superior BPDUs to prevent it from becoming Root
                    Port.
tcn-guard           Set port to stop propagating received topology changes
                    notifications and topology changes to other ports.

Chapter 11 VRRP

This chapter compares the commands used to configure Virtual Router Redundancy Protocol (VRRP). Cisco supports VRRP and Hot Standby Router Protocol (HSRP), HSRP is not compatible with VRRP.

In many networks, edge devices are often configured to send packets to a statically configured default router. If this router becomes unavailable, the devices that use it as their first-hop router become isolated from the network. VRRP, which is based on RFC 5798, uses dynamic failover to ensure the availability of an end node's default router. This is done by assigning the IP address used as the default route to a "virtual router," or VR.

On a given VLAN, a VR includes two or more member routers that you configure with a virtual IP address that is the default gateway's IP address. The VR includes an owner router assigned to forward traffic designated for the virtual router (If the owner is forwarding traffic for the VR, it is the master router for that VR) and one or more prioritized backup routers (If a backup is forwarding traffic for the VR, it has replaced the owner as the master router for that VR.)

VRRP CLI Comparison

ArubaOS-CX-Switch	ArubaOS-Switch	Cisco
router vrrp disable router vrrp enable	router vrrp ipv4 enable	
interface vlan 2	vlan 220	interface vlan 100
vlan 2 interface vlan 2 vrrp 2 address-family ipv4 address 10.1.100.1	vrrp vrid 220 virtual-ip-address 10.1.220.1	vrrp 100 ip 10.1. 100.1
priority 2	priority 254	vrrp 100 priority 100

vrrp 2 address-family ipv4 no shutdown	enable	
do show vrrp detail	show vrrp	show vrrp
		show vrrp brief
do show vrrp statistics	show vrrp vlan 220	show vrrp interface vlan 100

Chapter 12 ACLs

This chapter compares the commands for configuring access control lists (ACLs).

An ACL is a list of one or more access control entries (ACEs) specifying the criteria the switch uses to either permit (forward) or deny (drop) the IP packets traversing the switch's interfaces.

This chapter covers ACL basics, creating ACLs, applying ACLs for routing/Layer 3 operations, applying ACLs for VLAN/Layer 2 operations, and applying ACLs for port/interface controls.

When using these commands, keep in mind:

- On ArubaOS-Switch and Cisco, ACLs include an Implicit Deny as the last ACE. If traffic does not match an ACL rule, it is denied (or dropped).

Access Control Lists ('ACLs') allow a network administrator to define sets of rules based on network traffic addressing or other header content, and to use these rules to restrict, alter or log the passage of traffic through the switch. Choosing the rule criteria is called Classification, and one such rule set, or list, is called an Access Control List.

There are 3 classes of ACL - MAC, IPv4 and IPv6 - which are each focused on relevant frame/packet characteristics. ACLs can be configured to match on almost any frame or packet header field and then take an appropriate action.

Network traffic passing through a switch can be blocked, permitted, counted, or reprioritized based on many different frame/packet characteristics including, but not limited to:

- Frame ingress VLAN ID
- Source and/or destination Ethernet MAC, IPv4 or IPv6 address
- Layer 2 (EtherType) and Layer 3 (IP) protocol
- Layer 4 application port(s)

Different ACLs of the same type can be used in opposite directions. If an ACL of a particular type is applied in a direction that is already in use, the current ACL will be replaced by the new ACL. An ACL contains one or more 'Access Control Entries' ('ACE') which are listed according to priority by sequence number. A single ACE matches on one or more characteristics of the particular traffic type and has a configured action to either discard or allow the packet to continue through the switch. This occurs by, beginning with the ACE with the lowest sequence number, comparing the incoming or outgoing frame to its particular match characteristics and if there is a match, the ACE's action - either permit or deny - is taken. If there is no match, the match characteristics of the next ACE in sequence is compared to the relevant frame/packet details and if there's a match the specified action is taken.

Chapter 13 BGP

This chapter compares the commands used to enable and configure Border Gateway Protocol.

BGP, based on RFC 4271, is a routing protocol that enables BGP-speaking devices to exchange reachability information about independent networks called Autonomous Systems (ASs). These networks present themselves to other ASs as independent entities that have a single, coherent routing plan. BGP is the most commonly used protocol between Internet service providers (ISPs).

The characteristics of BGP are as follows:

- BGP focuses on the control of route propagation and the selection of optimal routes, rather than on route discovery and calculation, which makes BGP an exterior gateway protocol, different from interior gateway protocols such as Open Shortest Path First (OSPF) and Routing Information Protocol (RIP).
- BGP uses TCP to enhance reliability.
- BGP supports Classless Inter-Domain Routing (CIDR).

- BGP reduces bandwidth consumption by advertising only incremental updates, and is therefore used to advertise a large amount of routing information on the Internet.
- BGP eliminates routing loops completely by adding AS path information to BGP routes.
- BGP provides abundant policies to implement flexible route filtering and selection.
- BGP is scalable.

A router advertising BGP messages is called a BGP speaker. It establishes peer relationships with other BGP speakers to exchange routing information. When a BGP speaker receives a new route or a route better than the current one from another AS, it will advertise the route to all the other BGP peers in the local AS.

BGP can be configured to run on a router in the following two modes:

- iBGP (internal BGP)
- eBGP (external BGP)

When a BGP speaker peers with another BGP speaker that resides in the same AS, the session is referred to as an iBGP session; and, when a BGP speaker peers with a BGP speaker that resides in another AS, the session is referred to as an eBGP session.

BGP CLI Comparison

ArubaOS-CX-Switch	ArubaOS-Switch	Cisco

BGP CLI Configurable options

ArubaOS-CX-Switch	
ArubaOS-CX-Switch(config)# router	
bgp	BGP specific commands
graceful-restart	Configure graceful restart for routing process
ospf	Configure OSPF or enter the OSPF configuration context
ospfv3	Configure OSPFv3 or enter the OSPFv3 configuration context.
pim	Configure PIM, or enter PIM configuration context
vrrp	VRRP information

```

ArubaOS-CX-Switch(config)# router bgp
  <1-65535> The autonomous system (AS) number of the BGP process.

ArubaOS-CX-Switch(config)# router bgp 65534
  vrf VRF Instance
  <cr>

ArubaOS-CX-Switch(config)# router bgp 65534

ArubaOS-CX-Switch(config-router)#
  aggregate-address To create an aggregate entry
  bgp BGP specific commands
  disable Disable BGP instance
  distance Configure the administrative distances for BGP routes
  enable Enable the BGP instance on the VRF
  end End current mode and change to enable mode
  exit Exit current mode and change to previous mode
  list Print command list
  maximum-paths Forward packets over multiple paths
  neighbor Specify neighbor router
  network Specify a network to announce via BGP
  no Negate a command or set its defaults
  redistribute Redistribute information from another routing protocol
  timers Adjust routing timers

ArubaOS-CX-Switch(config-router)# bgp
  always-compare-med Compare MED attribute for BGP best-path selection across neighbors
  in different AS
  bestpath Change the default best-path selection
  cluster-id Configure Route-Reflector Cluster-id
  default Configure BGP defaults
  deterministic-med Pick the best-MED path among paths advertised from the neighboring
  AS
  graceful-restart Configure graceful-restart capability parameters
  log-neighbor-changes Log BGP neighbors session state changes
  maxas-limit Maximum AS numbers allowed in routes learned from peers
  router-id Override configured router identifier

ArubaOS-CX-Switch(config-router)# bgp router-id
  A.B.C.D Configure the BGP router identifier for the VRF

ArubaOS-CX-Switch(config-router)# bgp router-id 10.0.0.1
  <cr>

ArubaOS-CX-Switch(config-router)# bgp router-id 10.0.0.1

ArubaOS-CX-Switch(config-router)# neighbor
  A.B.C.D Neighbor address
  WORD Peer Group name

ArubaOS-CX-Switch(config-router)# neighbor 10.0.0.20
  advertisement-interval Minimum interval between sending BGP routing updates
  allowas-in Accept as-path with my AS present in it
  default-originate Originate default route to this neighbor
  description Neighbor specific description
  ebgp-multihop Allow EBGp neighbors not on directly connected networks
  local-as Configure the local AS number for the EBGp neighbor
  maximum-prefix Number of routes allowed to be learnt from the specified neighbor.
  next-hop-self Configure own IP as nexthop for all routes advertised to the
  neighbor
  passive Do not initiate BGP session for this neighbor
  password Set a password
  peer-group Member of the peer-group

```

```

port                Neighbor's BGP port
remote-as           Configure the AS of the neighbor
remove-private-AS  Remove private AS number from outbound updates
route-map          Route-map filter to apply for the neighbor
route-reflector-client  Configure a neighbor as Route Reflector client
send-community     Send Community attribute to this neighbor
shutdown           Administratively shut down this neighbor
soft-reconfiguration  Per neighbor soft reconfiguration
timers             BGP per neighbor timers
update-source      Source of routing updates
weight            Set default weight for routes from this neighbor

ArubaOS-CX-Switch(config-router)# neighbor 10.0.0.20 remo
  remote-as        Configure the AS of the neighbor
  remove-private-AS Remove private AS number from outbound updates

ArubaOS-CX-Switch(config-router)# neighbor 10.0.0.20 remote-as
  <1-65535> AS number

ArubaOS-CX-Switch(config-router)# neighbor 10.0.0.20 remote-as 6543
  <cr>
ArubaOS-CX-Switch(config-router)# neighbor 10.0.0.20 remote-as 6543

ArubaOS-CX-Switch(config-router)# redistribute
  connected  Redistribute directly attached networks
  ospf       Redistribute OSPFv2 routes
  static     Redistribute static routes

ArubaOS-CX-Switch(config-router)# redistribute connected
  route-map  Apply route-map policy for redistribution
  <cr>

ArubaOS-CX-Switch(config-router)# redistribute connected

ArubaOS-CX-Switch(config-router)# redistribute static

ArubaOS-CX-Switch(config-router)# enable

```
ArubaOS-Switch(config)# router bgp ?
<1-65535>          The autonomous system number for the BGP routing process on this
router
```

```
ArubaOS-Switch(config)# router bgp 64502 ?
bgp                Configure various BGP parameters.
disable            Disable BGP on the router.
distance           Configure the administrative distances for BGP routes.
enable             Enable BGP on the router.
neighbor           Add/Modify/delete entries of the BGP peer table.
network            Advertise a network to the BGP neighbors if the network exists in
the routing table.
redistribute       Advertises routes from the specified protocol to the BGP
neighbors.
timers             Configure global keepalive and hold-time values for BGP.
<cr>
```

```
ArubaOS-Switch(config)# router bgp 64502
```

```

ArubaOS-Switch(bgp) # bgp
  allowas-in          Specify the number of times the local AS may appear in an AS-path.
  always-compare-med  Compare MEDs for routes from neighbors in different ASs.
  bestpath            Configure various BGP best-path options.
  client-to-client-r... Enable or Disable client-to-client route reflection.
  cluster-id          Specify the cluster ID to be used when the BGP router is used as a
                      route-reflector.
  default-metric      Specify a BGP MED to be set on routes when they are advertised to
                      peers.
  graceful-restart    Configure BGP graceful restart timers.
  log-neighbor-changes Enable or disable BGP event logging.
  maximum-prefix      Specify the maximum number of routes that BGP will add to its
                      routing table.
  open-on-accept      Configure BGP to send an Open message immediately when the TCP
                      connection has been established for configured peers.
  router-id           Configure a BGP router-id to be used during neighbor session
                      establishment and in BGP best-path selection.

ArubaOS-Switch(bgp) # bgp router-id ?
  IP-ADDR             A 32-bit integer in ipv4-address format to be used as the BGP
                      router-id

ArubaOS-Switch(bgp) # bgp router-id 10.0.0.2

ArubaOS-Switch(bgp) # ?
  bgp                 Configure various BGP parameters.
  disable             Disable BGP on the router.
  distance            Configure the administrative distances for BGP routes.
  enable             Enable BGP on the router.
  neighbor            Add/Modify/delete entries of the BGP peer table.
  network            Advertise a network to the BGP neighbors if the network exists in
                      the routing table.
  redistribute        Advertises routes from the specified protocol to the BGP
                      neighbors.
  timers              Configure global keepalive and hold-time values for BGP.

ArubaOS-Switch(bgp) # neighbor 10.0.101.31 ?
  allowas-in          Specify the number of times the local AS # may appear in an
                      AS-path.
  as-override         Replace all occurrences of the peer AS number with the router's
                      own AS number before advertising the route.
  description         Configure description for this BGP peer or peer-group.
  dynamic             Enable or disable advertisement of dynamic capability to the peer.
  ebgp-multihop       Enable or disable multi-hop peering with the specified EBGP peer,
                      and optionally indicate the maximum number of hops (TTL).
  graceful-restart    Enable or Disable the advertisement of graceful-restart
                      capability.
  ignore-leading-as   Allow any received routes that do not have their own AS appended
                      to the as-path.
  local-as            Configure the local AS # used for peering with this peer .
  maximum-prefix      Specify the maximum number of routes BGP will accept from the
                      specified peer.
  next-hop-self       Force BGP to use the router's outbound interface address as the
                      next hop for the route updates to the peer.
  out-delay           Specify the delay-time before advertising the route updates to the
                      peer.
  passive            If enabled, do not initiate a peering connection to the peer.
  password            Use MD5 authentication for the peer and set the password to be
                      used. If in enhanced secure-mode, you will be prompted for the
                      password.
  remote-as          Add an entry to the neighbor table, specifying the AS # of the BGP
                      peer.

```

remove-private-as	Specify whether the private AS # should be removed from the as-path attribute of updates to the EBGp peer.
route-map	Specify a route-map to be applied for filtering routes received from or sent to the peer.
route-reflector-cl...	Act as a route reflector for the peer.
route-refresh	Enable or disable the advertisement of route-refresh capability in the Open message sent to the peer.
send-community	Enable or disable sending the community attribute in route updates to the peer.
shutdown	Shutdown the BGP peering session without removing the associated peer configuration.
timers	Configure the keepalive and hold-time values for the peer.
tll-security	Configure the TTL security for this peer.
update-source	Specify the source address to accept TCP connections from the peer.
use-med	Enable or disable the comparison of MED attribute for the same route received from two different autonomous systems.
weight	Specify the weight for all routes received from the specified peer.

```
ArubaOS-Switch(bgp)# neighbor 10.0.101.31 remote-as 64503 ?
<cr>
```

```
ArubaOS-Switch(bgp)# neighbor 10.0.101.31 remote-as 64503

```
Router configuration commands:
```

address-family	Enter Address Family command mode
aggregate-address	Configure BGP aggregate entries
auto-summary	Enable automatic network number summarization
bgp	BGP specific commands
default	Set a command to its defaults
default-information	Control distribution of default information
default-metric	Set metric of redistributed routes
distance	Define an administrative distance
distribute-list	Filter networks in routing updates
exit	Exit from routing protocol configuration mode
help	Description of the interactive help system
maximum-paths	Forward packets over multiple paths
neighbor	Specify a neighbor router
network	Specify a network to announce via BGP
no	Negate a command or set its defaults
redistribute	Redistribute information from another routing protocol
scope	Enter scope command mode
synchronization	Perform IGP synchronization
table-map	Map external entry attributes into routing table
template	Enter template command mode
timers	Adjust routing timers

```
Cisco(config-router)#neighbor ?
```

A.B.C.D	Neighbor address
WORD	Neighbor tag
X:X:X:X::X	Neighbor IPv6 address

```
Cisco(config-router)#neighbor 10.0.101.21 ?
```

activate	Enable the Address Family for this Neighbor
advertise-map	specify route-map for conditional advertisement
advertisement-interval	Minimum interval between sending BGP routing updates
allowas-in	Accept as-path with my AS present in it
capability	Advertise capability to the peer
default-originate	Originate default route to this neighbor
description	Neighbor specific description
disable-connected-check	one-hop away EBGp peer using loopback address
distribute-list	Filter updates to/from this neighbor
dmzlink-bw	Propagate the DMZ link bandwidth
ebgp-multihop	Allow EBGp neighbors not on directly connected networks
fall-over	session fall on peer route lost
filter-list	Establish BGP filters
ha-mode	high availability mode
inherit	Inherit a template
local-as	Specify a local-as number
maximum-prefix	Maximum number of prefixes accepted from this peer
next-hop-self	Disable the next hop calculation for this neighbor
next-hop-unchanged	Propagate next hop unchanged for iBGP paths to this neighbor
password	Set a password
peer-group	Member of the peer-group
prefix-list	Filter updates to/from this neighbor
remote-as	Specify a BGP neighbor
remove-private-as	Remove private AS number from outbound updates
route-map	Apply route map to neighbor
route-reflector-client	Configure a neighbor as Route Reflector client
send-community	Send Community attribute to this neighbor

shutdown	Administratively shut down this neighbor
slow-peer	Configure slow-peer
soft-reconfiguration	Per neighbor soft reconfiguration
soo	Site-of-Origin extended community
timers	BGP per neighbor timers
translate-update	Translate Update to MBGP format
transport	Transport options
ttl-security	BGP ttl security check
unsuppress-map	Route-map to selectively unsuppress suppressed routes
update-source	Source of routing updates
version	Set the BGP version to match a neighbor
weight	Set default weight for routes from this neighbor

```
Cisco(config-router)#neighbor 10.0.101.21 remote-as ?
<1-4294967295> AS of remote neighbor

```

```
Cisco(config-router)#network 10.0.241.0 ?
backdoor Specify a BGP backdoor route
mask Network mask
nlri Specify nlri type for network
route-map Route-map to modify the attributes
<cr>
```

```
Cisco(config-router)#network 10.0.241.0 mask ?
A.B.C.D Network mask
```

```
Cisco(config-router)#network 10.0.241.0 mask 255.255.255.0
```

```
Cisco#show ip bgp ?
```

A.B.C.D	Network in the BGP routing table to display
A.B.C.D/nn	IP prefix <network>/<length>, e.g., 35.0.0.0/8
all	All address families
cidr-only	Display only routes with non-natural netmasks
community	Display routes matching the communities
community-list	Display routes matching the community-list
dampening	Display detailed information about dampening
extcommunity-list	Display routes matching the extcommunity-list
filter-list	Display routes conforming to the filter-list
import	Display route topology import / export activity
inconsistent-as	Display only routes with inconsistent origin ASs
injected-paths	Display all injected paths
ipv4	Address family
ipv6	Address family
l2vpn	Address family
labels	Display Labels for IPv4 NLRI specific information
neighbors	Detailed information on TCP and BGP neighbor connections
nexthops	Nexthop address table
nsap	Address family
oer-paths	Display all oer controlled paths
paths	Path information
peer-group	Display information on peer-groups
pending-prefixes	Display prefixes pending deletion
prefix-list	Display routes matching the prefix-list
quote-regex	Display routes matching the AS path "regular expression"

```

regexp      Display routes matching the AS path regular expression
replication  Display replication status of update-group(s)
rib-failure  Display bgp routes that failed to install in the routing
             table (RIB)
route-map    Display routes matching the route-map
summary     Summary of BGP neighbor status
template     Display peer-policy/peer-session templates
topology     Routing topology instance
update-group Display information on update-groups
update-sources Update source interface table
version      Display prefixes with matching version numbers
vpn4        Address family
vpn6        Address family
|           Output modifiers

```

```

Cisco#show ip bgp summary

Chapter 14 OSPF

This chapter compares the commands you use to enable and configure Open Shortest Path First (OSPF).

OSPF is a link-state routing protocol you can apply to routers grouped into OSPF areas identified by the routing configuration on each router. The protocol uses Link-State Advertisements (LSAs) transmitted by each router to update neighboring routers regarding that router's interfaces and the routes available through those interfaces.

Each router in an area also maintains a link-state database (LSDB) that describes the area topology. The routers used to connect areas to each other flood summary link LSAs and external link LSAs to neighboring OSPF areas to update them regarding available routes. In this way, each OSPF router determines the shortest path between itself and a desired destination router in the same OSPF domain (AS [Autonomous System]).

The OSPFv2 configurations in this chapter start with single area, then configuring multiple areas, after which adding stub and totally stubby components, and then the show/display OSPF commands. Each section builds upon the next adding additional OSPF capabilities.

OSPF CLI Comparison

ArubaOS-CX-Switch

ArubaOS-Switch

Cisco

router ospf 2 enable	router ospf enable	router ospf 1
router-id 10.0.0.41		router-id 10.0.0.41
area 0	area 0	
area 10.1.220.0	vlan 220 ip ospf area 0	network 10.1.220.0 0.0.0.255 area 0
router ospf 2 redistribute connected	router ospf redistribute connected	router ospf 1 redistribute connected
show ip ospf		Show ip ospf
Show ip route ospf	Show ip route	Show ip route ospf
Show ip ospf neighbour		Show ip ospf neighbour

OSPF CLI Configurable options

ArubaOS-CX-Switch	
ArubaOS-CX-Switch(config)# router	
bgp	BGP specific commands
graceful-restart	Configure graceful restart for routing process
ospf	Configure OSPF or enter the OSPF configuration context
ospfv3	Configure OSPFv3 or enter the OSPFv3 configuration context.
pim	Configure PIM, or enter PIM configuration context
vrrp	VRRP information
ArubaOS-CX-Switch(config)# router ospf	
ospf	Configure OSPF or enter the OSPF configuration context
ospfv3	Configure OSPFv3 or enter the OSPFv3 configuration context.
ArubaOS-CX-Switch(config)# router ospf	
<1-63>	Specify the OSPF Process ID
ArubaOS-CX-Switch(config)# router ospf 2	
vrf	VRF Instance.
<cr>	
ArubaOS-CX-Switch(config)# router ospf 2	
ArubaOS-CX-Switch(config-ospf-2)#	
area	Configure OSPF area parameters
default-metric	Configure metric of redistributed routes.
disable	Disable OSPF process
distance	Configure OSPF administrative distance
enable	Enable OSPF process
end	End current mode and change to enable mode
exit	Exit current mode and change to previous mode
graceful-restart	Configure graceful-restart for OSPF
list	Print command list
max-metric	Configure stub router advertisement
maximum-paths	Configure maximum number of ECMP routes that OSPF can support
no	Negate a command or set its defaults
passive-interface	Configure the interfaces to suppress OSPF routing updates
redistribute	Redistribute routes from another routing protocol
rfc1583-compatibility	Compatible with RFC 1583. Turned off by default.
router-id	Configure OSPF router identifier
trap-enable	Enable OSPF SNMP Traps. Default is disabled.
ArubaOS-CX-Switch(config-ospf-2)# enable	
ArubaOS-CX-Switch(config-ospf-2)# area	
<0-4294967295>	Set area id in decimal format

```

A.B.C.D      Set area id in IPv4 address notation

ArubaOS-CX-Switch(config-ospf-2)# area 0
  default-metric  Configure cost for the default route used for a stub or NSSA area
  nssa           Configure OSPF area as NSSA
  range         Summarize routes matching address/mask on border routers only
  stub          Configure OSPF area as stub
  virtual-link   Configure a virtual link

Appendix A CLI Commands in ArubaOS-Switch Software

This appendix shows display commands added to ArubaOS-Switch software.

Included are related ArubaOS-CX-Switchsoftware commands. Refer to the latest release notes for your switch product to determine which commands are supported.

HPE Networking has added CLI commands into the ArubaOS-CXSwitch software in a phased manner over several releases to help network management staff learn to use the ArubaOS-Switch software CLI with a minimum of effort.

ArubaOS-CX-Switchwas used for this section.

Fundamental Commands

ArubaOS-Switch commands
copy startup-config tftp <ip-address> <file name>
clock set <HH:MM:SS> <MM/DD/YYYY>
clock summer-time
clock timezone
aaa accounting commands
aaa authorization commands radius
No equivalent ArubaOS-Switch software command
No equivalent ArubaOS-Switch software command
copy
erase startup-config
flow-control
console inactivity-timer
exit
boot
erase startup
copy tftp startup-config
end
write memory
reload at
reload after
terminal length
set authentication password
console baud-rate
startup-default config <config file name>
hostname
configure
telnet
telnet-server
console terminal
no
Sys-debug ip fib blackhole
Sys-debug ipv6 fib blackhole
Sys-debug destination logging
Sys-debug destination buffer
Ipv6 route <network/subnetmask> blackhole logging
Ip route <network/subnetmask> blackhole logging
Access-list logtimer <5-300>
Sys-debug acl
Sys-debug destination buffer
Sys-debug destination logging
vsf sequence-reboot {primary secondary}

vsf domain 20
vsf lldp-mad ipv4 10.1.1.1 v2c public
vsf member 4 link 1 name NAME-STR
vsf member 4 link 1 all start-disabled
vsf member 4 link 1 all
vsf member 4 link 1
vsf member 4 priority 255
vsf member 4 remove reboot
vsf member 4 remove
vsf member 4 shutdown
vsf member 4 type <jnum> mac-address <mac-ad>
vsf member 4 type <jnum>
vsf port-speed 1g
vsf port-speed 10g
vsf vlan-mad 707

Display Commands
